

## Common Sound Issues: Are You Experiencing Any Of These Problems?

ABSORPTION

- Speech Intelligibility
  Reverberation
  Sound Quality  
 Loudness
  Echo
  Hearing Protection

ISOLATION

- Sound Transfer
  Impact Noise  
 Vibration Noise
  Low Frequencies

## PROJECT SUMMARY

**Absorption:** Yes  
**Isolation:** Maybe  
**Install:** Easy - Difficult  
**Cost:** \$\$- \$\$\$

## Planning Checklist

### MUST KNOW

- Room Dimensions
- Ceiling Height
- New Build or Retrofit

### GOOD TO KNOW

- Type of Lighting
- Ventilation/Ductwork
- Fire Suppression Systems
- Current Sound Treatments

## Questions to ask an Acoustic Specialist

- *What type of solution should I consider?*
- *What kind of results can I expect from this acoustic treatment?*
- *Can I solve my problem in stages, or do I have to buy all at once?*
- *How does installation work? Do I need to buy any hanging hardware or tools separately?*
- *What questions haven't I asked yet that I should ask before making a decision?*

## LEVEL OF COVERAGE

## TYPICAL APPLICATIONS

<b>Light Absorption</b> 5% - 25% of Wall Surface Area	Appropriate for live recording or listening rooms, offices, conference rooms and rooms where people gather and converse.
<b>Moderate Absorption</b> 25% - 50% of Wall Surface Area	Suits listening and control rooms that typically feature more subdued music, as well as larger business spaces. Moderate absorption of around 50 percent is a good estimate for many home theaters.
<b>Heavy Absorption</b> 50% - 100% of Wall Surface Area	Suits drum rooms, music practice space, rooms that handle high-energy music. Vocal booths and recording isolation booths require the most absorption.

## Ask yourself, What does success sound like?

Make sure you buy a solution, not a product. Your solution starts with understanding your problem and having realistic goals to attain.

## TYPE OF TREATMENT NEEDED

### **ABSORPTION: YES**

Sound absorption takes care of many sound issues at the source. Audimute's Acoustic Panels achieve results by absorbing mid and high-frequency sounds before they can scatter and distort around rooms.

### **ISOLATION: MAYBE**

Sound isolation addresses sound issues that bother people outside of the room in question. Isolation treatments either add mass to walls, or work as a constrained layer to transform sound. Either way, isolation (or "barrier") materials prevent sound from passing between neighboring areas.

### **We Recommend:**

#### **2" Thick Acoustic Panels**

**Why?** Acoustic panels are acoustically and aesthetically powerful allies in the studio that help to balance and "round out" the room's sound quality.

#### **If Necessary: Corner Mounted 4" Thick Bass Traps**

**Why?** Bass traps are effective and versatile and can be used in a modular way to tailor bass frequencies.

## PRO TIPS: Get The Most Out of Your Sound Treatment

- Consider installing cameras instead of exposing studio windows. Windows are often the most reflective element of a room.
- Break up large reflective surfaces.
- Try to apply absorption in live room in ways that will give you some adjustability.
- Soundproofing, or sound isolation, is only necessary if you are experiencing considerable sound transmission.

## TAKE THE NEXT STEP

Consult with an acoustic specialist to get personalized advice

call us at (866) 505-6883
