Planning Checklist

MUST KNOW

- ☒ Room Dimensions
☒ Ceiling Height
☒ New Build or Retrofit

GOOD TO KNOW

- ☒ Type of Lighting
☒ Ventilation/Ductwork
☒ Fire Suppression Systems
☒ Current Sound Treatments

Questions to ask an Acoustic Specialist

- *What type of solution should I consider?*
- *What kind of results can I expect from this acoustic treatment?*
- *Can I solve my problem in stages, or do I have to buy all at once?*
- *How does installation work? Do I need to buy any hanging hardware or tools separately?*
- *What questions haven't I asked yet that I should ask before making a decision?*

LEVEL OF COVERAGE

TYPICAL APPLICATIONS

Light Absorption

5% - 25%
of Wall Surface Area

Appropriate for live recording or listening rooms, offices, conference rooms and rooms where people gather and converse.

Moderate Absorption

25% - 50%
of Wall Surface Area

Suits listening and control rooms that typically feature more subdued music, as well as larger business spaces. Moderate absorption of around 50 percent is a good estimate for many home theaters.

Heavy Absorption

50% - 100%
of Wall Surface Area

Suits drum rooms, music practice space, rooms that handle high-energy music. Vocal booths and recording isolation booths require the most absorption.

Ask yourself, What does success sound like?

Make sure you buy a solution, not a product. Your solution starts with understanding your problem and having realistic goals to attain.

TYPE OF TREATMENT NEEDED

ABSORPTION: YES

Sound absorption takes care of many sound issues at the source. Audimute's Acoustic Panels achieve results by absorbing mid and high-frequency sounds before they can scatter and distort around rooms.

ISOLATION: NO

Sound isolation addresses sound issues that bother people outside of the room in question. Isolation treatments either add mass to walls, or work as a constrained layer to transform sound. Either way, isolation (or "barrier") materials prevent sound from passing between neighboring areas.

We Recommend:

2" Thick Fabric and Image Acoustic Panels

Why? A combination of fabric and image acoustic panels can be an effective, bold, and inspirational decorative statement that takes care of sound clarity issues common to conference rooms.

2" panels are usually the most acoustically suitable.

PRO TIPS: Get The Most Out of Your Sound Treatment

- When possible, place absorption at a height where sound is being generated. For conference rooms, the sound source is usually the voices of seated people.
- Treat all four walls if possible.
- Be conservative; start with approximately 10% coverage.
- Considering image panels? Don't over do it! It can be distracting and reduce the visual impact of the artwork.
